UPWON

Outdo. Scale. Win.

Website CMS Dynamic Sections

& SaaS-Level UI / UX Upgrade Specification

Internal Engineering & Design Brief

Prepared for: UpWon (Byte Elephants Technologies)

Prepared by: Sumago Infotech Pvt. Ltd., Nashik

Reference: upwon.sumagodemo.com | Source brief: 02_UpWon_Website_Developer_Brief.pdf

Version 1.0 | May 2026 | Confidential

1. Executive Summary

This document is a focused engineering and design recommendation for the UpWon website currently staged at upwon.sumagodemo.com. It builds on the UpWon Website Developer Brief and answers two questions:

- **CMS scope:** Which sections of which pages should be admin-editable so that marketing can update copy, stats, clients, case studies, and lead hooks without a developer.
- **SaaS polish:** Where the current site falls short of a modern SaaS look-and-feel, and what specific animation, layout and interaction upgrades will close that gap.

> **Why this matters**
> UpWon is positioned as a lead-generation machine for a 7-platform enterprise suite. Every static section is a section the marketing team has to call a developer to change. Every missing micro-interaction is a moment the visitor compares UpWon to Zoho, Freshworks, or Salesforce and concludes UpWon is smaller. Both problems are fixable in one sprint cycle.

1.1 What this document does not cover

- Backend architecture of the 7 product platforms (ERP, SFA, FMS, HRMS, WMS, Vendor Portal, Mobile).
- CRM and email-automation tool selection (assumed Brevo + HubSpot/Leadsquared per the brief).
- Pricing of the website build itself.

2. Current-State Observations — upwon.sumagodemo.com

Quick read of the staged site against the developer brief and against best-in-class SaaS reference sites (Freshworks, Zoho, Razorpay, Hubspot, Postman). Numbered for traceability.

2.1 What is working

- Brand palette is on-spec: Navy + Orange + Cream is consistent.
- Sitemap structure broadly matches the 37-page brief.
- Demo CTA is present in the navigation.
- Mobile responsiveness is functional.

2.2 What is hurting the SaaS perception

- **Static stats.** The hero proof numbers (50+ deployments, 36,500+ users, Rs 16Cr+) are hard-coded. Marketing cannot update them without a developer.
- **No motion budget.** Sections appear instantly on scroll. No staggered entrance, no counter animation on stats, no parallax, no micro-interactions on cards. This is the single biggest tell that a site is not a SaaS product.
- **Generic illustrations.** Stock-style imagery does not match the brief's direction of real operations photography and actual UpWon dashboard mockups.
- **Hero is text-heavy.** No product UI on the right side of the hero. A SaaS visitor expects to see the product in the first 5 seconds.
- **Industry selector is missing.** The brief specifies an 8-pill industry switcher that swaps content. Current page lists industries as a static grid.
- **ROI calculator is missing.** This is the highest-converting interactive on the brief. Should be a Phase-1 deliverable, not Phase-2.
- **No exit-intent, no scroll bar, no content upgrades.** Lead-capture mechanics from Section 7 of the brief are not yet wired up.
- **Trust badges and 'No spam / Response in 2 hours' microcopy** are inconsistent across CTAs.

3. CMS-Dynamic Section Map

This is the master recommendation for which sections become admin-editable from day one. The principle: anything that a marketing person will plausibly update more than twice a year should be in the CMS. Anything structural — section order, layout, the existence of a stat block — stays in code.

> **Recommended CMS**
> The brief specifies Sanity.io. That is a good choice and we endorse it. If the team prefers an in-house panel (Node.js + MySQL, matching the existing UpWon stack), we can build a custom admin in 2-3 sprints with equivalent capability. The section map below is CMS-agnostic.

3.1 Legend

- **CMS (full):** Marketing edits everything — headline, sub, image, CTA, link.
- **CMS (data only):** Marketing edits numbers / list items only; layout stays fixed.
- **Static:** Developer-managed. Changes via code deploy.
- **Hybrid:** Some fields CMS, some hard-coded for structural integrity.

3.2 Homepage (Page 01) — section-by-section

Section	CMS Status	Editable Fields
S1 Hero	CMS (full)	Eyebrow, headline, sub, primary CTA text + link, secondary CTA text + link, trust strip (4 items), hero video / image upload
S2 Proof Numbers	CMS (data only)	4 stat objects: number, label, optional suffix (+, Cr, %, etc.)
S3 Client Logo Strip	CMS (full)	Add / remove / reorder client logos. Fields: name, logo image, optional link, optional brand-dot colour
S4 Problem Statement	CMS (full)	Section title, 4 problem cards (category, pain quote, icon), bottom-line text
S5 Industry Selector	CMS (full)	8 industry tabs: name, slug, 3 pain points, relevant platform icons, 1 stat callout
S6 Product Suite Overview	CMS (full)	7 platform cards: icon, name, one-liner, 2 outcome bullets, link to product page
S7 ROI Results	CMS (data only)	6 result cards: metric, headline, description, client name
S8 Featured Case Studies	CMS (full)	Pick 3 case studies from the Case Study collection — autopopulates
S9 Implementation Promise	CMS (full)	Headline, sub, 4 phase objects, 4 trust badges
S10 Lead Hook	CMS (full)	Hook title, sub, form fields, PDF upload, CRM tag, success message
S11 FAQ Strip	CMS (full)	Add / remove / reorder Q&A pairs. Linked to global FAQ pool
S12 Final CTA	CMS (full)	Headline, sub, form fields, micro-trust line

3.3 Product Pages (Pages 04-10) — 7 platforms

All 7 product pages share one template. Define it once in the CMS as a 'Product' document type. Marketing then creates a new record for each platform.

Field Group	CMS Status	Notes
Hero	CMS (full)	Platform name, tagline, hero formula headline, sub, hero UI mockup image
Before / After	CMS (full)	Two columns of 4-6 pain / gain points each
Module Breakdown	CMS (full)	N expandable modules: name, description, 3 capabilities
Feature-Benefit-Outcome	CMS (full)	Table rows: feature, what it enables, outcome metric
Integration Strip	CMS (full)	Add / remove integration logos with optional link
Mid-page CTA	Static + CMS overlay	Layout fixed; only headline + form id editable
Proof Stats (4 boxes)	CMS (data only)	Number + label per box
Linked Case Study	CMS (full)	Pick from Case Study collection
FAQ	CMS (full)	4 platform-specific Q&A

Field Group	CMS Status	Notes
Bottom CTA	Static	Shared global component
SEO meta	CMS (full)	Title, description, OG image, schema overrides

3.4 Industry Pages (Pages 11-20) — 10 verticals

Same logic as product pages: one template, one CMS document type, 10 records. These are the highest-converting SEO pages, so the SEO meta fields must be in the CMS.

Field Group	CMS Status	Notes
Hero	CMS (full)	Pain statement in industry language, hero background image
4 Challenges	CMS (full)	Verbatim pain quote + category per card
Relevant Platforms	CMS (data only)	Pick which of the 7 platforms are most relevant (visual selector)
Before / After	CMS (full)	Industry-specific operational transformation
Industry ROI Data	CMS (data only)	Stat objects with metric + context
Linked Case Study	CMS (full)	Pick from Case Study collection
Industry FAQ	CMS (full)	5 questions only an insider would ask
Industry Lead Hook	CMS (full)	Pick from Lead Hook collection
SEO meta	CMS (full)	Critical — these are the SEO landing pages

3.5 Case Studies (Pages 22-24, expandable)

Define as a Case Study collection. Marketing should be able to add a new case study end-to-end without a developer. Currently planned: Monginis, Kaka Halwai, U2 Cake; the brief expects this to grow.

Field	CMS Status	Notes
Hero	CMS (full)	Client name, category + city, one-line challenge, 4 headline stats
The Challenge	CMS (full)	3-4 paragraph rich-text
Why UpWon	CMS (full)	Decision narrative, alternatives considered
What We Delivered	CMS (full)	Platform-by-platform summary with timeline
The Results	CMS (full)	N result cards: metric, context, supporting quote
Client Quote	CMS (full)	Pull quote, name, designation, company, optional photo
What Came Next	CMS (full)	Expansion / post go-live narrative
Linked CTA	Static	Standard final CTA component
Cover Image / Logo	CMS (full)	Used on listings, social cards

3.6 Other CMS-Managed Content Types

In addition to pages, the following global collections should exist as their own CMS document types so they can be edited independently of any single page.

Collection	Used On	Why CMS
Client Logo	Homepage strip, About, Footer	Logos change as new clients land. Today this needs a code deploy.
Testimonial / Quote	Homepage, product pages, demo page	Sales team gets new quotes every quarter.
Lead Hook (Content Offer)	All pages with downloads	Each hook has its own PDF + form + CRM tag. Marketing must control these.
FAQ (global pool)	Homepage, product, industry	Reuse same FAQ in multiple places. Tag-based filtering.
Blog Post	/resources	Standard CMS-managed blog with rich-text, content upgrade CTA per post.
Team Member	/about, /careers	Bios, photos, leadership additions.
Job Opening	/careers	HR posts new roles directly.
Stat (global)	Footer, About, multiple pages	One stat updated once propagates everywhere it appears.
Integration Partner	Product pages, About	Zomato, Swiggy, ONDC, Tally — list grows.
Announcement Bar Message	Site-wide top bar	Marketing controls the rotating 3 messages.
Navigation / Menu	Header, footer	Reorder, hide, label-change without deploy.
Form Definition	Demo, audit, partner, proposal	Form fields, CRM tag, success message, redirect URL per form.

3.7 What stays static (and why)

Not everything belongs in the CMS. Putting structural choices behind a form invites mistakes. The following stay as code:

- Page layouts and section order (changing section order should be a design decision, not a marketing decision).
- Brand colour tokens and typography scale — managed via Tailwind config.
- Animation timing, easing curves, transition durations.
- ROI Calculator formulas (the math behind the savings projection).
- Legal pages (T&C, Privacy) — change via dev with version control for compliance auditability.
- Schema markup structure — only the values inside fields are CMS-driven.

4. Admin Panel — UX Requirements

Whatever CMS we choose, the admin panel should follow these baseline rules so marketing actually uses it instead of asking dev.

4.1 Role-based access

Role	Can Edit	Cannot Edit
Marketing Editor	Pages, blog, case studies, lead hooks, testimonials, FAQ, stats, logos	Site settings, form definitions, redirects, schema
Marketing Admin	All marketing content + form definitions + announcement bar + global stats	Code, schema markup structure, redirects
Developer / Super Admin	Everything	—
Sales (read-only)	View leads, view form submissions, export to CSV	Anything else

4.2 Editor experience must-haves

- **Live preview.** Edit a hero headline, see it on the actual page layout in a side-by-side preview before publishing. Sanity Studio does this natively.
- **Draft vs Publish.** Marketing edits a draft, gets review from a manager, publishes. No accidental live changes.
- **Scheduled publishing.** Set a campaign launch date — content goes live automatically.
- **Revision history.** Roll back any field to a previous version. Critical for legal-sensitive copy.
- **Image transformations on the fly.** Upload one image; CMS serves it as WebP, multiple sizes, with proper srcset. Sanity + Next.js next/image handles this.
- **Field validation.** Stat numbers must be numeric. Email fields must be valid. CTA buttons must have a link. Block publish if validation fails.
- **Character counters.** Meta titles capped at 60, descriptions at 160. SEO-aware editor.
- **Linked references.** When marketing updates a case study, all pages that link to it auto-refresh.

5. SaaS-Level UI / UX Improvements

This is where the new site can move from 'corporate brochure' to 'serious SaaS product'. The brief already lists most of these in the design direction, but several were dropped or weakened in implementation. Below is a prioritised list with implementation specifics.

5.1 Hero — make it look like a product

- **Add a real product UI in the hero.** Right side of hero shows a MacBook + iPhone dual mockup with a 12-15s looping screen recording of UpWon ERP dashboard → SFA mobile app. No static screenshot. Real motion is the #1 SaaS signal.
- **Animated particle network background.** Subtle navy-on-navy particles representing supply-chain nodes connecting. Use tsParticles or react-tsparticles. 60fps cap; pauses on prefers-reduced-motion.
- **Headline reveals word-by-word.** On page load, headline animates in with a 60ms stagger per word using Framer Motion. Sub-headline fades up 200ms after.
- **Parallax depth.** Background moves at 0.5x scroll speed; device mockup moves at 1.05x. Creates depth.
- **CTA shimmer sweep.** Primary CTA gets a subtle orange-to-white-to-orange light sweep every 6 seconds. Signals 'click me' without being aggressive.

5.2 Numbers — make them animate, not just appear

- **Counter animation on scroll-into-view.** Every stat counts up from 0 to its final value over 1.5s with ease-out cubic. Use react-countup or a 30-line custom hook. Triggers via IntersectionObserver.
- **Stagger across the stat row.** All 4 stats do not start at the same instant — 100ms stagger between them. This is what separates polished from default.
- **Underline accent draw.** A small orange underline draws beneath each number after the count completes, 300ms ease.

5.3 Industry Selector — implement it properly

- **8 pill tabs in a horizontal row,** with the active pill filled orange. Below the tabs, a content panel that crossfades (250ms) when a tab is clicked.
- **URL hash sync.** Clicking 'Bakery' updates URL to /#bakery so the link is shareable and Back button works.
- **On mobile:** horizontal scroll with snap-points, not a dropdown. Snap-points feel like a native iOS picker.

5.4 Card and section animations

- **Scroll-triggered entrance.** Default for every section: opacity 0 to 1, translateY 24px to 0, 500ms, cubic-bezier(0.25, 0.46, 0.45, 0.94). Stagger 80ms between sibling cards.
- **Card hover lift.** translateY -4px, box-shadow deepens from 0 4px 12px rgba(30,36,97,0.08) to 0 12px 32px rgba(30,36,97,0.16). Orange top-border appears (height 3px). 200ms ease.
- **Image hover zoom (case studies).** Image scales 1.0 to 1.05 inside an overflow-hidden parent. 400ms ease.
- **Section dividers as angled cuts.** Use CSS clip-path: polygon between dark navy and cream sections. Modern SaaS sites do this; corporate sites use flat horizontal lines.

5.5 Micro-interactions on forms

- **Floating labels.** Field labels start as placeholder text, animate up and shrink when the user clicks into the field. Material-style but with UpWon colours.
- **Real-time validation.** Email field shows a green check the moment the regex passes. Mobile field formats as the user types (+91 9356 898 277).
- **Submit button states.** Default → Loading (spinner) → Success (green check + 'Booked. Check your email.') → All within the button itself, no page reload.
- **Error microcopy.** Not 'Required field' — say 'Tell us your name so we know who is calling.' Friendly and on-brand.

5.6 Navigation

- **Mega-menu for Products and Industries.** On hover, a full-width dropdown shows all 7 platforms with icons and one-liners. Not a thin vertical list.
- **Active state indication.** Current page's nav item gets a 2px orange underline that draws in 200ms on page load.
- **Scroll-shrink.** Nav bar height shrinks from 72px to 56px on scroll. Logo scales 0.85x. Subtle but expected on SaaS sites.
- **Mobile menu: full-screen slide-in from right,** not a thin dropdown. CTA at the bottom is sticky and prominent.

5.7 ROI Calculator — build it as the centrepiece interactive

- **4 sliders on the left,** live result panel on the right. Numbers transition smoothly using react-countup as sliders move.
- **Result panel uses big typography** (60-80px Sora Bold for total savings) with smaller breakdowns underneath.
- **Visual feedback on slider move.** Slider track fills orange as user drags. A small pop animation on the result number every time it changes.
- **Lock-and-capture pattern.** Once user moves all 4 sliders at least once, a soft pulse on the 'Get My Full ROI Report' button. Form appears below — Name, Mobile, Email — and on submit, a PDF with their inputs is generated server-side and emailed.

5.8 Empty states, loading states, and skeletons

- **Page transitions.** Use Next.js loading.tsx for each route. Show a skeleton with the brand's cream background and pulsing card shapes. Never a white blank page.

- **Image loading.** Use next/image with a blur placeholder generated from the image's dominant colour. The image fades in over 200ms when loaded.
- **Search empty state.** On the resources hub, if a search has no results, show an illustration and 'No results. Try wastage, franchise, or ERP — these are our top reads.'

5.9 Dark-mode option (Phase 2)

Not in the brief, but a strong SaaS-perception signal. Add a sun/moon toggle in the footer. Use CSS variables and prefers-color-scheme as the default. Tailwind handles this out of the box.

5.10 Accessibility — non-negotiable

- All animations respect prefers-reduced-motion. Disable particles, counters, parallax.
- Colour contrast ratio minimum 4.5:1 on body text. Currently the slate #666677 on cream passes; double-check every variant.
- Keyboard navigable: every dropdown, slider, accordion, modal must work without a mouse.
- ARIA labels on icon-only buttons (WhatsApp, scroll-to-top, chat).
- Focus rings visible — 2px orange outline, not the default browser ring.

6. Animation System — Tokens and Examples

Define animation as a system, not per-component. This table is the canonical reference. Implement these in Tailwind config and Framer Motion variants.

Token	Duration	Easing	Usage
motion-instant	100ms	ease-out	Hover state colour change, focus ring appear
motion-quick	200ms	ease-out	Hover lifts, button states, dropdown open
motion-base	300ms	cubic-bezier(0.25,0.46,0.45,0.94)	Modal open, tab crossfade, accordion expand
motion-smooth	500ms	cubic-bezier(0.25,0.46,0.45,0.94)	Section entrance, card stagger reveal
motion-emphatic	800ms	cubic-bezier(0.16,1,0.3,1)	Hero headline reveal, count-up final value
motion-stagger	80ms	—	Delay between sibling elements in a group
motion-counter	1500ms	ease-out	Stat counter 0 to final value

6.1 Framer Motion variant example

Drop-in variant for any section reveal. Wrap children in motion.div with this variant and animate on viewport-enter once.

> **Code reference (drop in /lib/motion.ts)**
>
> export const sectionReveal = { hidden: { opacity: 0, y: 24 }, visible: (i = 0) => ({ opacity: 1, y: 0, transition: { delay: i * 0.08, duration: 0.5, ease: [0.25, 0.46, 0.45, 0.94] } }) };

6.2 Libraries

- **Framer Motion —** core animation. Used everywhere.
- **tsParticles —** hero background particle network. Lightweight, configurable.
- **Lottie —** for the implementation timeline animation and any illustrated micro-animations. Designers export from After Effects.
- **react-countup —** stat counter animations.
- **Embla Carousel —** logo strip marquee and any horizontal-scroll components. Avoid heavy carousel libraries like Swiper for performance.

7. Lead-Capture Wiring — what to build with CMS

The brief specifies 10 lead hooks. Wire each one as a CMS-managed Lead Hook record so marketing can launch new hooks without code.

Lead Hook Field	Type	Notes
Name	Text	Internal label, e.g. 'Ops Report 2025'
Title (public)	Text	Heading shown on the page
Subtitle	Long text	Value proposition
Asset PDF	File upload	Stored in CMS, served from CDN
Form fields	Repeater	Name, type (text/email/dropdown/checkbox), required, placeholder
CRM tag	Text	e.g. report-download-ops-2025
Lead-score weight	Number	0-100, default per hook type
Email automation ID	Text	Brevo / Mailchimp campaign ID
Success message	Text	Inline confirmation copy
Where it appears	Multi-select	Homepage, blog sidebar, exit intent, industry pages, etc.
Active	Boolean	Toggle off without deleting

7.1 Form submission flow

- User submits form → POST to /api/lead with hook id + form data.
- Server validates, writes lead to CRM via Brevo/HubSpot API, tags with hook's CRM tag.
- Server triggers email automation (drip sequence) via campaign ID.
- Server returns success JSON; client shows inline confirmation.
- Server fires GA4 conversion event with hook id.
- Sales team receives Slack / email notification for hot leads (demo, ROI calc, free audit).

8. Phased Roadmap

Realistic sequencing assuming a 3-developer team (1 frontend, 1 backend / CMS, 1 designer-developer).

Phase 1 — Foundation (Weeks 1-4)

- CMS setup (Sanity or custom panel) with content types: Page, Product, Industry, Case Study, Lead Hook, Client Logo, FAQ, Testimonial, Stat, Team Member.
- Migrate existing copy from staging into CMS.
- Implement design tokens, animation system, and global components (nav, footer, announcement bar, floating widgets).
- Homepage end-to-end with hero animations, counters, industry selector, problem cards, ROI calculator (functional).
- Demo page, contact page, About page.

Phase 2 — Depth (Weeks 5-8)

- All 7 product pages from template.
- All 10 industry pages from template.
- All 3 case study pages.
- Comparison pages (UpWon vs SAP, UpWon vs Tally).
- Implementation page, Free Audit page, Partner page with earnings calculator.
- All 10 lead hooks wired with PDFs, forms, automation.

Phase 3 — Polish & SEO (Weeks 9-12)

- Blog setup, first 8 blog posts published.
- Schema markup on all key pages, validated via Google Rich Results Test.
- 301 redirects from byteelephants.com and old URLs.
- Performance pass: Lighthouse 90+, Core Web Vitals green.
- Exit intent, scroll bar, content upgrades, A/B test infrastructure.
- Hindi version planning (translation memory in CMS, locale switching).

9. Success Metrics

How we know it worked. Baseline values from byteelephants.com analytics; targets within 90 days of launch.

Metric	Baseline (old)	90-day Target
Homepage bounce rate	TBD	Below 45%
Demo bookings per month	TBD	+ 60%
Lead hook downloads per month	0	200+
ROI calculator completions per month	0	80+
Lighthouse Performance score (mobile)	TBD	90+
Largest Contentful Paint	TBD	Below 2.5s
Organic search traffic	TBD	+ 40%
Avg session duration	TBD	+ 30%
Pages per session	TBD	2.4+

9.1 What gets measured weekly

- New leads by hook, by source.
- Form abandonment rate per form (which field drops people off).
- Scroll depth on each page (Hotjar).
- Heatmap of demo page and ROI calculator (where the eye goes, where the click lands).

Appendix A — Quick Comparison: Current Site vs Recommended

Aspect	upwon.sumagodemo.com (today)	Recommended
Hero visual	Static text + illustration	MacBook + iPhone with looping product UI
Stat counters	Plain numbers	0-to-final count-up on scroll, staggered
Section transitions	Hard appear	Staggered fade-up, 500ms ease
Industry selector	Static grid	8-pill tab switcher with crossfade
ROI calculator	Not present	Live sliders with animated result panel
Hero background	Flat colour	Particle network + parallax
CTA buttons	Static	Subtle shimmer sweep + hover lift
Forms	Standard inputs	Floating labels, inline validation, in-button states
Mobile menu	Standard dropdown	Full-screen slide-in with sticky CTA
Image loading	Direct load	Blur placeholder + fade-in via next/image
Content updates	Code deploy required	Marketing edits via CMS, draft → publish workflow
Lead hooks	None wired	10 hooks, CMS-managed, automated PDF + email
Exit-intent capture	None	Email-only popup after 30s, once per 7 days
Dark mode	None	Optional Phase 2 toggle
Accessibility	Partial	WCAG 2.1 AA, reduced-motion respected

Appendix B — Recommended Tech Stack (matches brief)

Layer	Tool	Why
Framework	Next.js 14 App Router	SSR for SEO, React for interactivity, ISR for fast updates
CMS	Sanity.io (or custom Node + MySQL panel)	Real-time collaborative editor, image pipeline, GROQ queries
Styling	Tailwind CSS + CSS variables	Token-driven, dark-mode-ready, consistent
Animation	Framer Motion + tsParticles + Lottie	Production-grade, SSR-safe, reduced-motion aware
Forms	React Hook Form + Zod	Type-safe, accessible, low re-render
Hosting	Vercel	Edge network, automatic deploys, preview URLs per PR
Search	Algolia (Phase 2)	Site-wide search, faceted filters on resources
Email	Brevo (formerly Sendinblue)	Transactional + marketing, Indian-rupee pricing
CRM	HubSpot or Leadsquared	Lead scoring, pipelines, drip campaigns
Analytics	GA4 + Microsoft Clarity + Hotjar	Quant + session recording + heatmaps
Live Chat	Crisp	Branded, low-latency, mobile app for sales team
Booking	Cal.com (self-hosted) or Calendly	Embed on demo page; Cal.com is open-source
Monitoring	Sentry + Vercel Analytics	Error tracking + Web Vitals real-user monitoring

Closing

Two things move UpWon from a website to a SaaS-grade product surface: putting marketing-editable content into a real CMS so the team can move fast, and treating animation, micro-interaction and progressive disclosure as first-class design tokens, not a 'polish pass' at the end. Both can ship in Phase 1. The roadmap above is conservative; with focus, the homepage rebuild alone is a 3-week effort.
